

## Module 11

I didn't have any questions for my group because I wasn't sure what questions they could answer about my project. At this point, my portfolio is running smoothly and I would probably consult the internet if I needed coding help. I would have liked to have gotten more from the SCRUM day but I've already been reflecting on the SCRUM questions internally so I didn't really discover anything new. I think my group felt similarly, as they couldn't really think of any questions for me either. At this point, we tried to think of some questions in order to write this report. I asked Rachel about the program she uses to code, since I noticed she was using a different one than me. I might use this program in the future, but am in too deep with my current website to make the switch right now. I also looked at her latest graphic mockup, which gave me a good idea of how someone else is treating their portfolio, and was able to compare it to my own.

I didn't spend much time in class working on my portfolio in class since it's so early and I need approximately 3 more cups of coffee in me before I can start coding properly. However, I did get to know my group better and clarify some procedural things about the class. I set the goal to correct my website according to the feedback I got from my group members. This was achieved by changing the structure/ architecture of my site to accommodate the required resumé and contact pages.

Most of the help I sought out came from the internet, which proved to be an amazing resource. I used the internet in a couple ways: by inspect-element-ing sites to see how they handled their code, and by using online tutorials to learn how to code specific elements.
